

SWADHIN TANDI

Software Engineer · Full-Stack Developer · Application Security Analyst

✉ swadhintandi@yahoo.com ·  linkedin.com/in/swadhin-tandi-97aa9b341 ·  github.com/blueorionn ·  swadhintandi.me

SUMMARY

Self-taught developer and security researcher with interests spanning **application security and full-stack web development**. Experienced in building web applications and security-focused tools, with practical knowledge of web application vulnerability research and API security. Maintains several actively developed open-source projects, with **480+ contributions** on GitHub in the past year.

TECHNICAL SKILLS

Full-Stack Development	Python Backend Development, System Design, Database Integration, Third-Party API Integration, React, Next.js
Application Security	Web Security, API Security, Reconnaissance, OSINT
Tools	VS Code, GitHub Actions, Burp Suite, Genymotion
Cloud	AWS, DigitalOcean
Development & Systems	Git, Docker, Linux

SECURITY RESEARCH

- Conduct hands-on web application and API security research through bug bounty programs and security labs.
- Analyze authentication, authorization, access control, business logic, and application workflows for security weaknesses.
- Perform manual HTTP request/response analysis and vulnerability validation using industry-standard security tools.
- Research complex vulnerabilities including multi-step authorization issues, resource ownership flaws, JWT security, and client-side vulnerabilities.

FULL-STACK DEVELOPMENT

- Build full-stack web applications with Python-based backends (Flask, FastAPI, Django) and modern frontend frameworks (React, Next.js).
- Design application architecture, backend services, APIs, and database integrations.
- Develop REST APIs and integrate third-party APIs and external services.

Work with SQL and NoSQL databases for application data management.

Build automation and developer tooling using Python, TypeScript, and related technologies.

PROJECTS

Cinexa

github.com/blueorionn/cinexa

Flask-based movie collection web application demonstrating JWT authentication, custom middleware, and NoSQL database integration. It supports role-based access with admin and user accounts, public and private movie entries, and seed data loading for quick setup. The app is Dockerized for deployment with Gunicorn and covered by pytest tests.

Flask 3.1

PyJWT

bcrypt

PyMongo

Tailwind CSS

Jinja2

MongoDB

Docker

Gunicorn

pytest

Pylint

BHHV (Burp HTTP History Viewer)

bhhv.vercel.app

Security tooling companion for Burp Suite Community Edition that solves the missing ability to save projects and HTTP history to disk. It parses, views, and searches HTTP history exported from Logger++ in CSV and JSON formats, with a responsive dashboard and detailed inspection of headers, parameters, payloads, and status codes.

Next.js (App Router)

TypeScript

React

Tailwind CSS

Vercel

Calcify

calcify.swadhintandi.me

Multi-calculator web suite featuring a basic calculator with arithmetic and memory functions, a BMI calculator, and live currency conversion with real-time exchange rates, plus scientific and graphing calculators in development. Calculator logic is built on a reducer pattern with safe math expression evaluation and is unit tested with Vitest.

Next.js 16

React 19

shadcn/ui

Tailwind CSS v4

mathjs

Vitest

Also actively maintained on GitHub: [Crypticworld](https://github.com/swadhintandi/crypticworld) — a browser-based security toolkit for hashing and encoding tasks (crypticworld.swadhintandi.me), and [Libera](https://github.com/swadhintandi/libera) — a Flask book-list application with session authentication and SQL database integration (github.com/blueorionn/libera).
